Cultural Directions for Azaleas, Broad-leaf Evergreens
And Similar Plants

Azaleas, Kalmias, Leucothoe, and Rhododendrons are acid-soil plants and will not succeed well in limestone soil. A deep, porous soil is essential. The ground should be excavated to a depth of about 2 feet, working in leaf-mold, humus, or well rotted stable manure. This mixture must be worked in carefully and packed tight around the roots. Fill in the excavation with rotted sod, muck or peat soil, mixed with a small quantity of sand.

The plants should be set the same depth as in the nursery, which is shown by the earth-line near the base. After planting, mulch with several inches of leaves or light litter, allowing this mulch to remain around the plants, and renew it annually in the autumn. A thin covering of rich soil may be used to advantage in holding mulch in place and to assist in decomposition. The mulch also tends to keep the soil cool in summer and protects against freezing in winter. If these simple instructions are observed, your planting of Broad-leaved Evergreens will be entirely successful.

For use in beds of Rhododendrons, Azaleas, and other similar plants we recommend the following: Galax, Shortia, Ferns, Orchids, Lilies, Trilliums, Cimicifugas, Iris, Polygonatum, Sanguinarias, and most of our other perennials.

RHODODENDRONS

RHODODENDRON CATAWBIENSE. Catawba Rhododendron.

Probably the most vigorous, hardy, free-blooming variety, with gorgeous display of rosy purple flowers in early summer. Foliage dark green and exceedingly showy. Hardest of all Rhododendrons.
